

Comparison across Sites: CMH- MRC- ZHH (no ASSET)

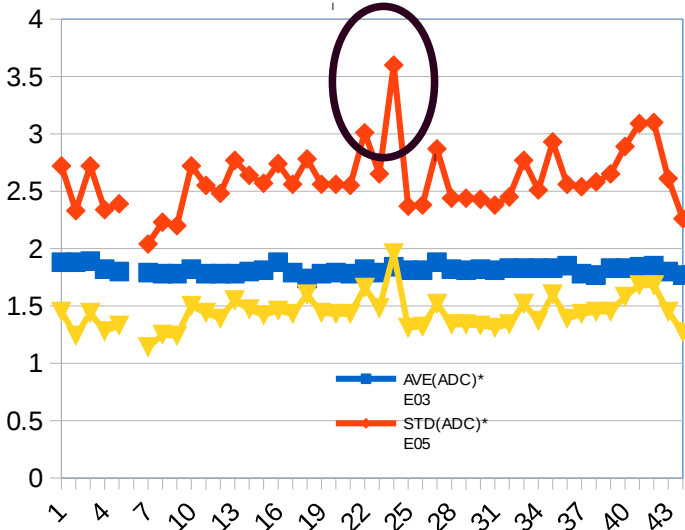

Means that
this data is
an outlier/
unusual

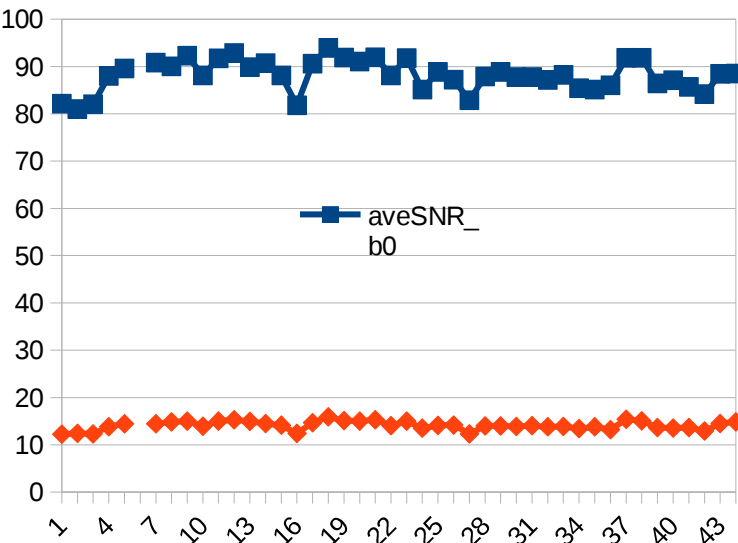

Means that
the trend in
the data
seems to
change
from this
time point
forward

CMH

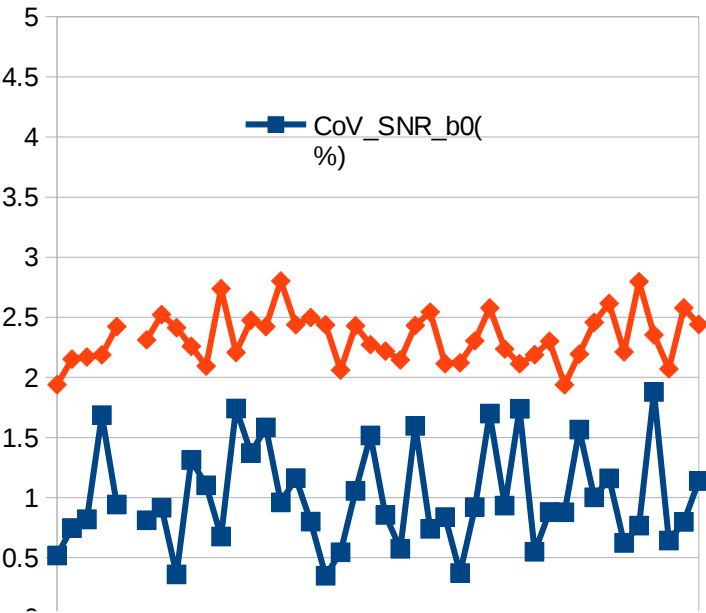

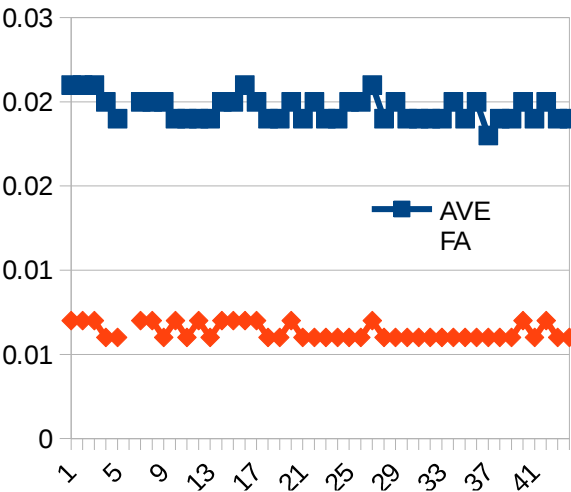

ADC no ASSET

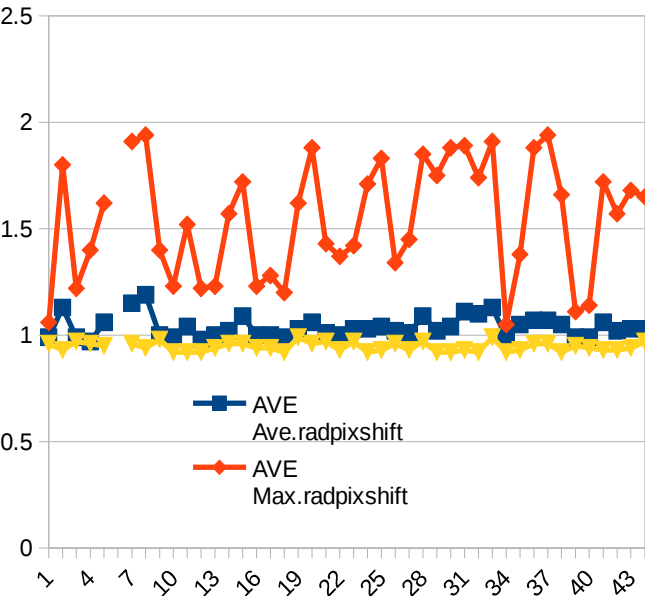

SNR no ASSET

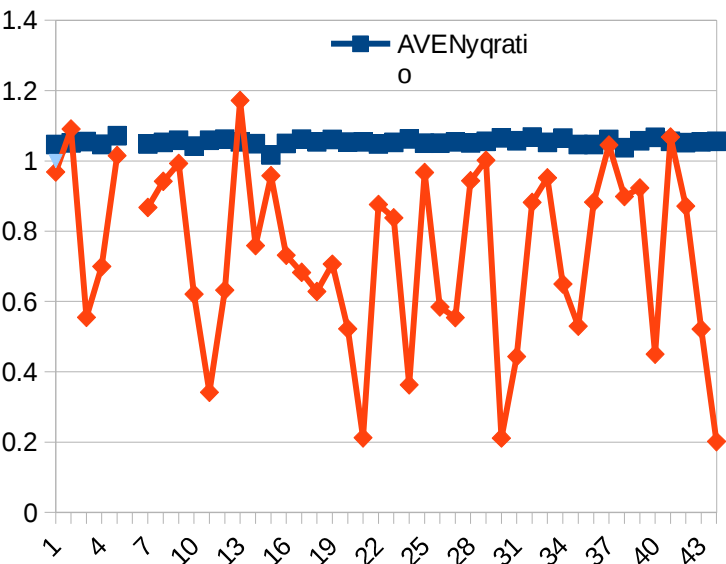

FA no ASSET

Eddy Current: Pixel Shifts no ASSET

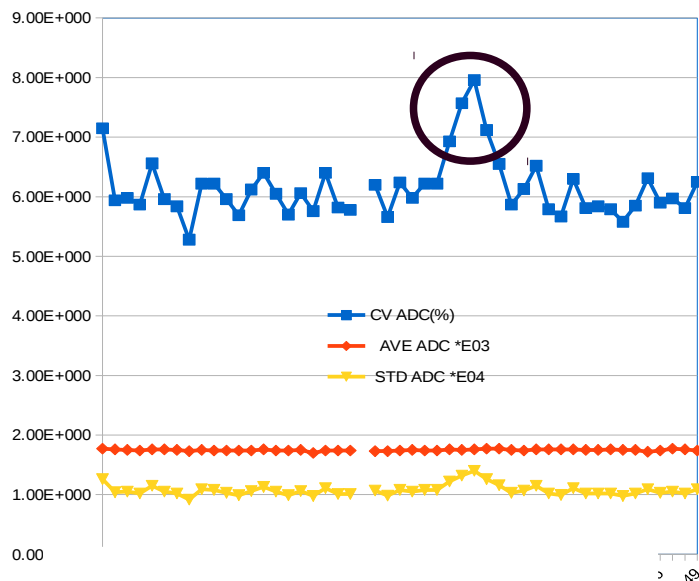

Nyquist Ghost

MRC

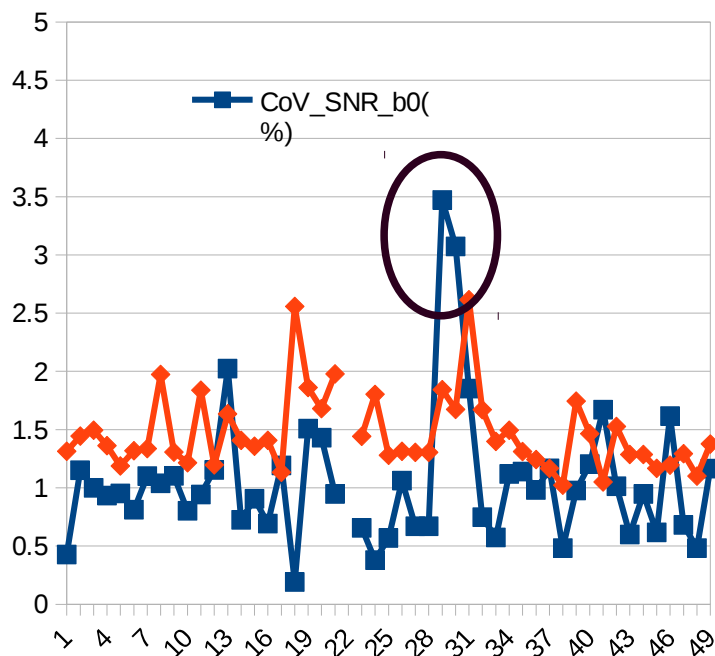

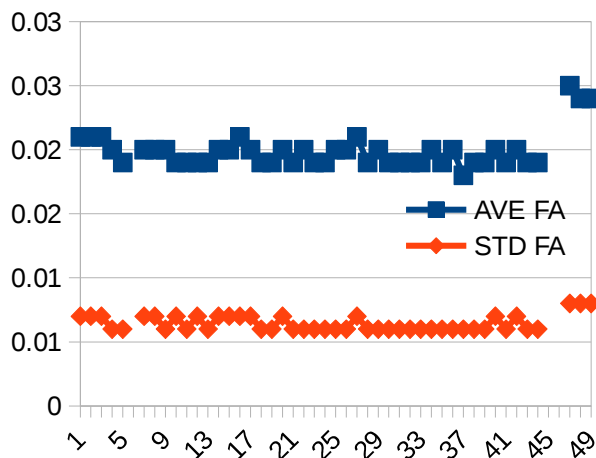

ADC no ASSET

SNR no ASSET

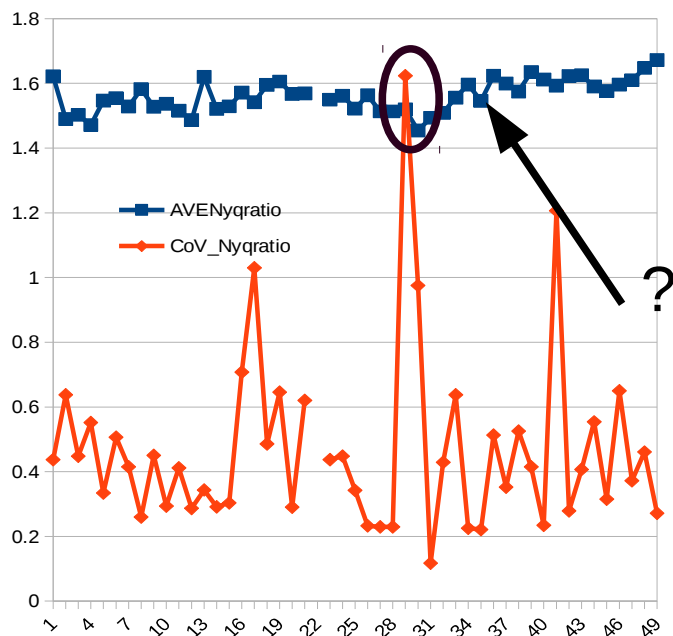

FA no ASSET

Eddy Current: Pixel Shifts no ASSET

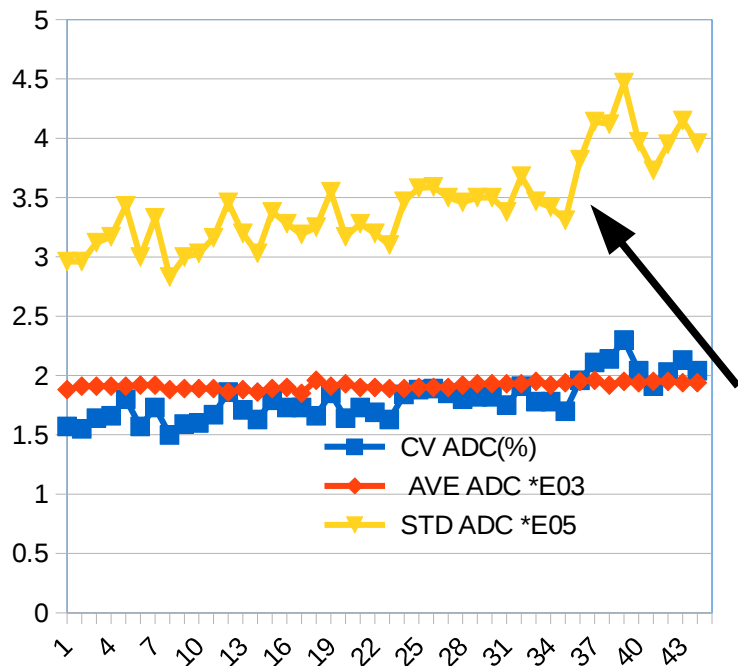

Nyquist Ghost

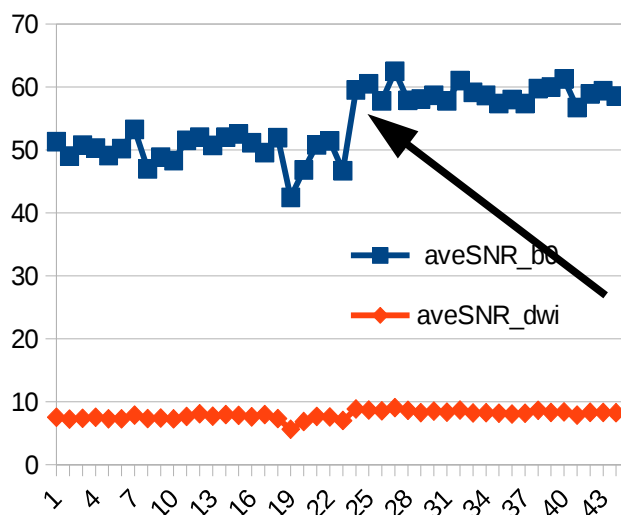

ZHH

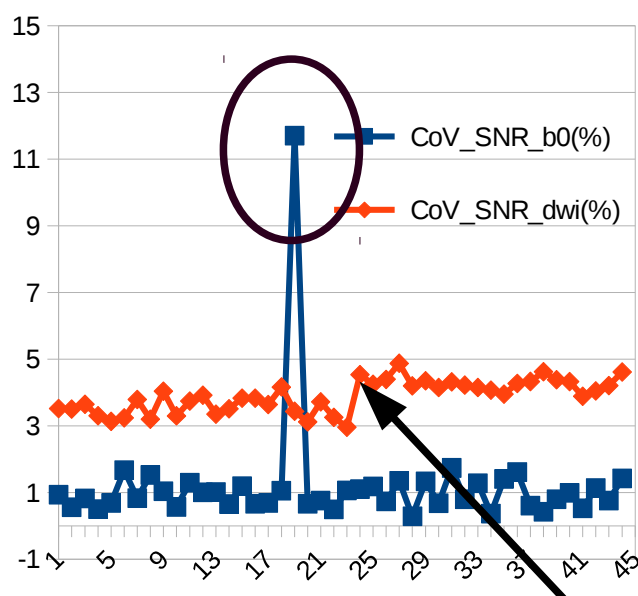

ADC no ASSET

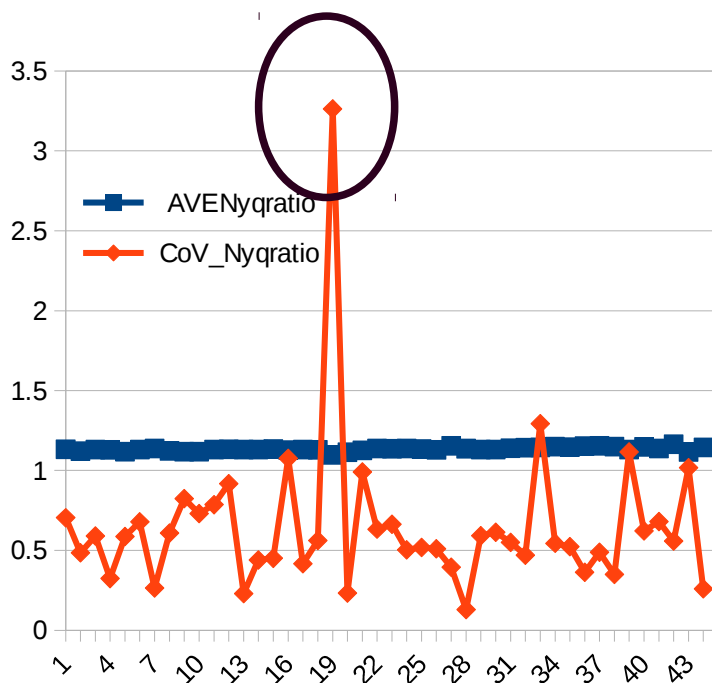

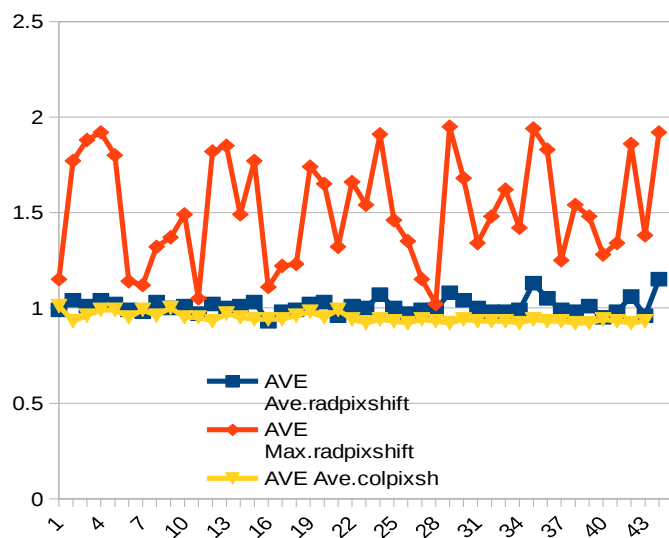

SNR no ASSET

FA no ASSET

Eddy Current: Pixel Shifts no ASSET

Investigating the outliers a little more closely...

ZHH_PHA_FBN0019

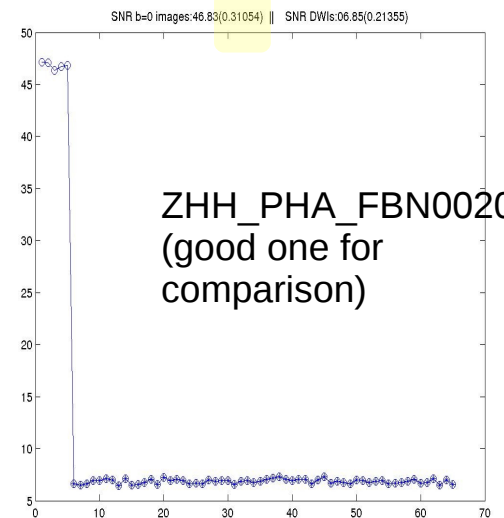

Looking into data in more detail reveals problem with data at time point #19:

- elevated background noise level for 1st grad dir (not apparent in SNR measure.. why??)
- changing std(noise) across 5 b=0 (don't see it in images, see it in plots)

ZHH_PHA_FBN0019

ZHH_PHA_FBN0020
(good one for comparison)

MRC_PHA_FBN0031

Bad
data

normalised ADC (wrt ave): ave(std)=1.76e-03(1.40e-04) mm²/s CV=7.96%

MRC_PHA_FBN0034

Good
data

normalised ADC (wrt ave): ave(std)=1.75e-03(1.03e-04) mm²/s CV=5.87%

Different scale!

Looking into data in more detail reveals problem with data at time points #29-#32:

- elevated ADC and std(ADC), not apparent why from images? Maybe change in phantom temperature?
